

Mohamed Taher SRAÏRI

Professor, Head of the School of Agricultural Sciences, Hassan II Agronomy and Veterinary Medicine Institute, Rabat – Morocco.

I am an agronomist (animal science), interested in livestock systems. At the beginning of my academic career, I have investigated the determinants of smallholder herds' performances in Morocco: milk yield and quality, profitability, etc. Then, I began working on the different dimensions of crop/livestock coupling. This brought me to study water productivity in dual purpose herds (milk and meat simultaneously): water volumes used and their origins (rainfall and/or irrigation), as well as the water used by the other crops on farms. The interest devoted to resource uses also brought me to the characterization of work uses in the Moroccan agricultural sector, in various regions (rain-fed, irrigations schemes, oases, etc.) and its remunerations.
